

By Jason Bruno

My first time hearing about DST Golf was at this years PGA Show, DST stands for delayed strike technology. The idea first evolved when Berti Cordle (former player on the European Challenge Tour and golf instructor) sought out the truth about what elements the best ball strikers in history have had in common regarding their dynamic motion leading up to and at impact. He studied the bio-mechanics of ball striking for the past 3 years, and the result of his research is the development of the DST Golf club (which is available in Compressor and CR10 models).

**DST**  
GOLF

When you make a swing with a club that has a center of gravity that is too far back, you will lose control of the club and the ball.

The club with the center of gravity that is too far back will not be able to control the ball.

The DST COMPRESSOR is a new technology that will help you control the ball.

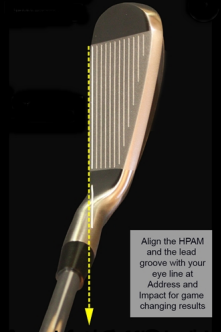

DST Golf's patent pending "Hand Position Alignment Master" technology has recently been approved by the USPTO for use in conforming clubs.

Allowing golfers around the world to consistently pre-set their impact position at address, just like the greatest players in history.

By simply returning the club to the same position at impact, all impact golfers will control the club face through the ball and improve their games dramatically.
